Contents

- 1. Objectives of the Test
- 2. Scope of testing
- 3. Test Strategy
- 4. Environment & Tooling Stack
- 5. Test Schedule
- 6. Entry Criteria
- 7. Exit Criteria
- 8. Risks & Mitigation
- 10. Metrics
- 11. Test Plan Requirements Matrix
- Appendix A - Test Cases

1. Objectives of the Test

The primary objective is to validate the stability, usability, and critical transactional paths of the public store frontend. Testing ensures that a user can seamlessly discover products, manage their cart, and complete an E2E purchase without any blocker defects.

2. Scope of testing

In-Scope

- **User Identity:** Registration, Login, Logout
- **Product Discovery:** Search, Product Catalog, Product Comparison, Configurable and Rental products
- **Cart & Checkout Journey:** Add to Cart/Wishlist, Cart Updates, Shipping Estimates, Checkout Flow.
- **Basic UI:** Navigation, homepage visibility

Out-of-Scope (For This Cycle)

- Third-party Payment Gateway integrations
- Database-level verification and backend API performance testing
- Security penetration testing
- Load/performance testing
- Accessibility testing beyond basic visual/usability observations

3. Test Strategy

To maximize release velocity and ensure stability, this project utilizes a **Hybrid Testing Strategy** combining manual exploratory testing with automated regression suites.

- **Automation Selection Criteria:** Scenarios classified as *High* priority, or those involving repetitive data entry (e.g., Login, registration, E2E checkout, complex cart configurations), are prioritized for automation.
- **Playwright Regression Suite:** Automated scripts are built using **Playwright**, leveraging its native fast execution, auto-wait capabilities, and robust cross-browser support.
- **Functional Testing:** Manual and exploratory testing of user stories against expected business logic.
- **Negative/Boundary Testing:** Validating input fields (e.g., entering letters in quantity boxes, invalid coupon formats).

4. Environment & Tooling Stack

Test Management & Tracking: Jira, Structured Test Suite with automated/manual status tracking.

Automation Ready Framework: Playwright utilizing Page Object Model (POM).

Browsers: Google Chrome (Latest), Safari (Latest).

Operating System: macOS/Windows

5. Test Schedule

The testing defined in this document will be completed according to the following schedule.

Phase	Activity	Timeline
Phase 1	Review application and identify test scope	Day 1
Phase 2	Write manual test cases	Days 2-3
Phase 3	Execute high/medium priority manual test cases	Days 4-5
Phase 4	Select automation candidates	Day 6
Phase 5	Configure Playwright framework, set up environment variables, design page objects.	Days 7-9
Phase 6	Debug failed automated runs, verify bug fixes, execute final sanity cycle.	Days 10-12

6. Entry Criteria

- The application under test is accessible at `https://demo.nopcommerce.com`.
- The in scope modules are finalized.
- High priority test cases are documented and reviewed.
- Required test data is prepared, including valid user details, invalid login data, product names, cart quantities, and checkout address data.
- The test browser and environment are ready.

7. Exit Criteria

- 100 % of high/medium priority test cases are executed.
- Critical user flows are tested.

- Failed test cases are documented.
- Bugs are reported with clear reproduction steps.
- Automated tests are executed and results are reviewed.
- No blocker issues remain unresolved for the tested scope.

8. Risks & Mitigation

Risk	Mitigation strategy
Tight release schedule.	Prioritise critical defects.
Inaccurate estimates(time, resources)	Monitor regularly and plan
Third-party users or automated resets wipe out product configurations or accounts on the public demo site.	Use dynamic test data and avoid depending on old accounts
Slow network responses or lazy-loading images cause automated checkout scripts to fail intermittently.	Leverage Playwright's native auto-waiting features and rely on resilient locator strategies (like getByRole or getByText) rather than brittle CSS/XPath selectors.

9. High Level Test Scenario Matrix

The following matrix outlines the core functional validation paths.

Module	Description	Priority
Identity Access	Validate new user account registration with valid, unique datasets.	High
Identity Access	Verify successful user authentication.	High
Search/Catalog	Execute global search operations using exact, partial, and empty field.	Medium
Search/Catalog	Verify category filtering and side-by-side product comparisons.	Medium
Cart	Validate "Add to Cart" workflows across different product configurations.	High
Cart	Assert real-time recalculations when updating quantities or removing items.	High

Checkout	Verify integrated country/state configuration options for shipping estimation.	Medium
Checkout	Execute end-to-end checkout flow seamlessly as an anonymous Guest User.	High
Checkout	Execute end-to-end checkout flow seamlessly as a Registered User.	High
